

Research Interests & Career Goals

My research interests focus on building intelligent systems that seamlessly combine information retrieval, language understanding, and predictive analytics. I am particularly passionate about **Retrieval-Augmented Generation (RAG) systems** and their applications in **education, finance, and decentralized technologies (Web3)**. I aim to explore innovative ways to leverage AI for **financial decision-making, risk modeling, and smart contract automation**.

My long-term goal is to become a **lead AI engineer**, designing **scalable, robust AI platforms** that empower organizations to make data-driven decisions. I aspire to contribute to cutting-edge AI research while developing **practical, real-world tools** that address complex challenges in finance, education, and emerging Web3 ecosystems.

I am deeply committed to **ethical AI, model interpretability, and accessibility**, ensuring that AI solutions are **transparent, responsible, and usable by non-technical users**. My passion lies in bridging the gap between advanced AI technologies and real-world impact, particularly in **financial engineering, decentralized finance (DeFi), and next-generation intelligent systems**.
