

Project 1: Car Price Prediction System

Developed a supervised machine learning model to predict car prices using historical sales data. The project involved data cleaning, feature engineering, model training, and evaluation. Deployed the model using Flask.

Project 2: Retail Sales Forecasting

Built a time-series forecasting model to predict monthly sales trends for an e-commerce platform. Used historical transaction data and implemented ARIMA and machine learning-based approaches.

Project 3: Retrieval-Augmented Generation (RAG) Chatbot

Designed a document-based question answering system using LangChain, vector embeddings, and a large language model. The chatbot retrieves relevant document chunks before generating accurate responses.

Project 4: Student Performance Prediction

Created a predictive analytics system to identify students at risk of poor academic performance using demographic and academic features.
